Uniwersytet SWPS

Task list no. 8 – In this lab, we will implement and test all major binary search tree operations

Task 1. Implement a structure to represent a node in a binary search tree and construct a tree containing 8 keys: 15, 6,18, 3, 7, 17, 20, 2.

Task 2. Implement the inorder traversal to visit all nodes in the tree and print all of the keys by inorder traversal.

Task3. Implement a function that searches the tree for a given key. Find 17, 2 in your tree and print the related message for each one.

Task 4. Implement finding the minimum, maximum, and successor nodes, and print the minimum, maximum, and successor of 3, 7, 15, and 2.

Task5. Implement deleting a key from a tree, and delete 18, 6 from your tree, and after each deletion, call inorder traversal and print your tree.

Note. The lab report should contain your code along with the results.

Note. ALL PROGRAMS SHOULD COMPILE WITHOUT ERROR AND WORK (i.e. DO EXACTLY WHAT IS DESCRIBED IN THE TASK)!!!
